

# PHP Form Mailer

This page is for users of the legacy PHP Form mailer, which for security reasons we'll soon need to retire from service. The tool was a simple mail script, which for some of you will have served as a contact-us form generator. Usually accessed via: <http://cgi.uk2.net/cgi-bin/uk2-formmail.pl>.

You're probably here as a user of a legacy PHP Form mailer. We regret to inform you, that this service will be discontinued on the 10th June 2020.

As an alternative, we would recommend speaking with your development team, or encourage you to implement a replacement script within the contents of your own hosting package.

We have provided two example scripts below, that can be used as a replacement. Please note that these will have to be downloaded to properly be viewed and customised to include the correct details.

- [send\\_form\\_email.php](#)
- [form.html](#)

We apologise for any inconvenience caused by this change, but we hope you appreciate that your security remains our top priority.
