

How To Configure A WordPress Domain with UK2

To configure your domain to work with your new UK2 WordPress hosting, you will need to login to your registrar's control panel and to change the nameservers to the following:

dns1.uk2.net

dns2.uk2.net

dns3.uk2.net

If you need an SSL certificate, you can order an SSL certificate from within your CHI control panel. The steps for this can be found [here](#)
